TECHNICAL DATASHEET

PITCHING RATE / DOSAGE

Pitch directly into the wort in the fermenter, at pitch rate of:

50 - 80g/hl of cool wort at 16-23°C / 61-73°F

The pitch rate is dependent on the brewing process conditions and will affect the fermentation performance and the final taste profile of the beer.

High gravity, high adjunct or high acidity fermentations may require higher pitching rates and the addition of yeast nutrients.

STORAGE

A sealed vacuum-packed package that has not been opened can be stored at room temperature (20°C / 68°F) in dry, odor-free conditions.

It can also be stored in a refrigerator (4°C / 41°F). Do not freeze.

Limit exposure to air. Once the package is opened, the yeast should be used immediately.

The shelf life is 36 months from the production date.

Do not use after the expiration date indicated on the package.

APPLICATION

It is generally recommended that active dry yeast is pitched directly into the wort without prior rehydration.

If direct pitching is not feasible the yeast can be hydrated and pitched in liquid form.

To rehydrate dissolve the dry yeast in sterile water or in wort at 16-23°C / 61-73°F at a ratio of 1:10. Stir gently and leave for approximately 20 minutes. Gently stir again and add to the cooled wort in the fermenter.

To avoid yeast stress, ensure temperature fluctuations are minimal.
